

## Guided Information Management

Information is the life-blood of every business. Having effective information management processes and tools can mean the difference between generating a healthy return on capital and putting a business at great risk. At MVS, insight into how information and processes transforms organizations is at the core of our mission.

In this age of new and exciting technology, one can get lost trying to find the best solution. Our job is to make the journey of finding the right tools that bring the most value to an organization using a smooth and repeatable process.

Introducing the **EISIL** methodology: **Evaluate, Improve, Select, Implement, and Learn.**

### Evaluate

Through a proprietary fact-finding process we uncover the tasks team members execute in their individual functions. The analysis starting at a departmental level is then rolled up across the entire organization. Using an information flow map, stakeholders can get a visual representation of information flow bottlenecks, process inefficiencies, and critical priorities.

### Improve

In this step information flow-map is then used to guide process improvement. The improved design is optimized at the departmental level and across the entire company.

### Select

Keeping in the mind the organization's resources, we focus on the most critical priorities. We may select new tools or upgrades to existing solutions from trusted vendors, with return on the investment being the ultimate goal.

### Implement

Perhaps the most critical step, the deployment plan is set into motion. All circumstances of the business are considered to make sure the implementation takes care of the short-term needs, while maintaining the path for long-term technology solutions.

### Learn

As the company grows because of improved efficiencies, new bottlenecks in productivity will eventually arise. Our job is to foster a culture of learning in the organization, and to recognize areas of improvement more efficiently early on before they become critical issues. Executing EISEL iteratively helps the company stay always be one step ahead and on the path towards long-term growth and sustainability
